paraphrased text here###ENDARTICLETo remove some toolbars to free up screen space, so you may have turned it off not knowing its function was. Close selection with Enter (you can select several entities), set the distance at the Tool Options bar and click into the screen at the desired side. In reply to this post by dellus What is the syntax for specifying an x,y coordinate on the command line? @-100,-100 works for me. How did you write it? What was the error or error message? I wrote 16,-12 and got the error message. Is it possible that I have the drawing limits set to only positive limits? If so, how do I change it?John. 16,-12 works for me when specifying a point for a line About positive limits on the drawing; If you can draw a line with the mouse on the negative area, then no, there are not positive limits in your drawing. It would be interesting to know what exactly the error message is so somebody could search its text inside the sources. Also what exactly did you to get that error, something in the style of "click on the line 2 points icon" then "click on the commandline widget" then "write 16,-12 and hit enter" and maybe also the version of LibreCAD you use HTH Pere Thank you for your response. I am going to try to make this as detailed as possible and respond to all of your points.I can use the snap selections to draw the items I want anywhere on the drawing.The version I am running is One operation that I used that gave the error is simply a circle command with center and radius.I entered 16,-12 and pressed enter resulting in the following: Thank you for your help. I look forward to hearing from you.Best Regards,John.On Mon, Feb 8, 2021 at 6:34 PM perepajal [via LibreCAD] wrote: 16,-12 works for me when specifying a point for a line About positive limits on the drawing; If you can draw a line with the mouse on the negative area, then no, there are not positive limits in your drawing. NAML OK, let's try again. I have the same version running as you. Initiate the operation with Tools - Circle - Center, Radius. In the Tool Options bar above the drawing area an input box for the radius appears. Set your radius there. I decide for 20. A circle with radius 20 will immediately hang at the drawing cursor. At the same time you are asked to specify the circle center in the Status bar at the bottom and in the separate bar under the command line window. Click into that bar and you get a blinking cursor there indicating activated and ready for input. Type in: 16,-12 and press Enter. It can happen that you don't close a previous command completely, it expects a repeated, continuous execution. But you may think you are doing a new command. This might produce confusion about the syntax. So if not sure end the previous command with a double Escape. So, I experimented using a circle, radius command with the radius set to 0.125. I entered the center location as 1,1 and it worked fine, 2,2 worked fine, 4,4 worked fine, but -4,4 gave the error as shown.1,1 2,2 4,4 -4,4 Expression Syntax Error! am starting to wonder if there is just a bug in my installation that does not recognize my "-" key. Any thoughts?On Tue, Feb 9, 2021 at 5:24 PM dellus [via LibreCAD] wrote: OK, let's try again. I have the same version running as you. Initiate the operation with Tools - Circle - Center, Radius.
