I'm not a bot

```
Firstly, approach the cooker, confidently and with a glint of resolve in your eye. Press the 'plus' and 'minus' buttons simultaneously, wait for a few seconds and then release them. The LED display will begin to flash with a '' symbol between the numbers. Use this window to adjust the time, using the plus button to move upwards, and the minus button
to wind time back a notch or two (enjoy the curious sense of power at this point, as you appear to be reversing time...). Once you're there, and the time is correct, simply wait for thirty seconds and resist touching any other timer buttons and functions! This brief pause will allow the time to set, and then operate correctly. You've done it! Have a glass
of wine to celebrate. You can now the set the alarm tone from three choices, using the minus button. Press it to hear the first option. Release and press again to hear the minus button after you've heard it - the tone will automatically select. For a
minute minder - press the function button, just once. The bell symbol will begin to flash, giving you a 5 second time frame to set the time duration. Do this using the plus and minus buttons - and the minute minder will be set. Upon timer countdown, the alarm you've selected will ring. You can also cancel the tone by pressing any buttons - similarly to
cancel the minute minder function, press the function button and plus / minus buttons simultaneously. My mother has a cooker (I forget the make) that won't operate unless the clock is set. Unfortunately my mother (who is a
pensioner) finds this tricky to do and often needs to wait for a friend to come around to do it for her (it's hard for me to help as I live a few hours drive away). Is there a way to enable the oven WITHOUT setting the clock? Perhaps there is a way to enable the oven WITHOUT setting the clock? Perhaps there is a way to enable the oven WITHOUT setting the clock? Perhaps there is a way to enable the oven WITHOUT setting the clock? Perhaps there is a way to enable the oven WITHOUT setting the clock? Perhaps there is a way to enable the oven WITHOUT setting the clock? Perhaps there is a way to enable the oven WITHOUT setting the clock? Perhaps there is a way to enable the oven WITHOUT setting the clock? Perhaps the
teach your mother to just press the clock buttons so that the clock buttons so that the clock doesn't need the clock to be right, just to think it has been
set. I've tried showing her how to set it (to any kind of random time) but she always hates doing it "in case I do something wrong" (even though I've told her that she won't do any harm). It's such a useless 'feature' - I can't see the point in it. you could try writing the step-by-step instructions on a piece of card with felt-tip pen. Perhaps there is a way to
disable this annoying feature? The clock can be bypassed, however this involves modifications to the internal wiring of the oven. Usually straightforward if you know exactly what you are doing. Potentially lethal if not. This should probably be in the appliance section, and I don't really see the relavence of her age, if she can't use it she can't use it and
that is all there is to it. The only option is to get a simpler cooker for her or one with a built in backup battery for the clock. There is another way but it would only suffix if the cooker for her or one with a built in backup battery for the clock. There is another way but it would only suffix if the cooker for her or one with a built in backup battery for the clock. There is another way but it would only suffix if the cooker for her or one with a built in backup battery for the clock.
unexpectedly after a power cut, possibly when the kitchen is unattended, and setting fire to a half-cooked meal left in it when the power went off. what make is the cooker...never heard of this before...I did over 20 years on domestic appliance development, this was never a featured discussed. My oven and my mothers oven is the same and I have
same problem with my mother at 86 not being able to set the clock. This was not helped when the council sent some one around to show her how to use the cooker and they advised her to switch it off on the wall. If I had got hold of the silly woman I would have given her a mouthful. It took some time to persuade my mother not to turn it off on the
wall. The oven was fitted because she is disabled and the height carefully set so she can use it in a wheel chair she looks up at the controls. The selector switch also causes a problem. Clearly needed to switch from oven to grill but although not as many options
as mine (11 options) it does have 6 options to select from and leaving it selected means oven light stays on. Try explaining to an 84 year old Thermal Grilling. The grill element and the oven fan operate alternately, circulating hot air around
the food. When using the thermal grill cooking function, select a maximum temperature of 200°C. Oddly it is something I use. And at least hers has not got fan and conventional oven with options of them. Although I suppose only the same as with her old oven with the
dampers to route the flue gases in different ways to control oven temperature. My clock gets used once a year. To do the turkey. No way am I waiting around for 6 hours to turn it off. But to be fair with my Belling touch any button and special
rails like those in filing cabinets stop shelves go I have hair pins to select from. My Belling is silly as far as shelves go I have hair pins to see the options as I have same problem. Takes me two hours on buses to do just 6 miles to her house. In good weather I use push
bike. So you are not alone. Thanks for the words of advice folks, and ericmark - sorry to hear that you too have the same problems! We have a Stoves Newhome GL716 which has this feature. All your mum needs to do is press the +
button once or twice. This should be covered in the instruction manual if you still have it. She will then see there is no danger in what she is doing. This will fool the oven into thinking the clock is set and allow her to use the oven/grill. Hope you manage to show her how to do it. the lock button. It's fairly common for the lock function to get stuck if the self-cleaning cycle was interrupted for any reason, like a power outage.[1] If the outlet is hard to reach, you could also cut the power to your oven and
hopefully reset the computer. 2 Press the "Self-Clean" button, then "Clear/Off" after 60 seconds. If turning the oven on and off didn't reset the computer, try asking it to run a self-cleaning cycle and then promptly cancel it. This should hopefully engage the lock function (even though it is already engaged) and then release it after you press the
"Clear/Off" button.[2] Make sure to wait long enough after pressing "Self-Clean" for the process to start. You can usually hear your oven's system start the cycle. Advertisement 3 Run a short self-cleaning cycle didn't work, try letting the oven run a self-cleaning
cycle. Set the timer for 1-2 hours and then let it do its thing. Give it several hours after the cleaning cycle to cool down, which should prompt the internal temperature gauge to release the lock function.[3] The internal temperature gauge to release the lock function.[3] The internal temperature gauge to release the lock function.
cycle is finished. Tip: If the oven still isn't unlocking at this stage, it could be that there is a problem with the temperature sensor. It may be registering that the oven door. Find an appliance repair company in your area who can fix the brand and model
of oven you have. Some companies may offer a free estimate, especially if you're a new customer, so spend some time looking at companies, reviews, and rates to find a provider you're comfortable with.[4] Doing a DIY repair or finding a way to force the door open can result in more expensive damage than if you were to just call a repair person to
come to take a look at the oven. Even if you manage to get the oven door open on your own, you still don't know the underlying cause that is making the lock function engage when it shouldn't be. Advertisement 1 Check that the "Child Lock" button isn't engaged. This button often gets accidentally engaged during cleaning, and turning it off is simple!
Hold down the button for 4-5 seconds to see if that clears the lock icon. If not, try holding down the "Clear/Off" button for 4-5 seconds to see if there is a way to reset the
computer. Every brand of oven is slightly different, but many have a process that will reset the oven door to unlock. It may be something like pressing the "Clock" button and the "Clear/Off" button at the same time for 10 seconds, or holding down on the "Child Lock" button for 30 seconds. The exact way to do
this will depend on the brand of oven you have. For instance, the way to unlock a General Electric oven is different from unlocking a Bosch. Tip: If you don't know where your oven's user manual is, search online PDF version. 3 Let the oven cool
down to room temperature if there is food inside of it. Many newer ovens have a safety feature that will lock the oven if it registers a super high temperature, and sometimes the internal temperature of your oven gets to be higher than what it was set to. Turn off the oven and give it 30-90 minutes to cool down; then try opening the door or pressing
the "Clear/Off" button to disengage the lock function.[6] This can be super frustrating since your food is in the oven! But if you can't get the door to unlock any other way, this is your only option. Make sure to turn the oven! But if you can't get the door to unlock any other way, this is your food. 4 Turn the circuit breaker off for 5-10 minutes, then
turn it back on. This is a simple way to cut the power to the door unlocked, it may be time to call in a professional.[7] It's best to avoid using alternate means to try and force the door open, like a bent hanger or wire. This can cause more
damage and cost you more money to repair in the long run. Advertisement 1 Unplug the oven for 5 minutes and then plug it back in to reset the computer panel, making it so that your oven can't function normally. Before trying anything
else, cut off the power to the oven to see if that will jog it to reset.[8] You could also try turning off the circuit breaker directly if the outlet to your oven is hard to reach. 2 Open the door and located on the exterior of the oven that hooks into a small opening on
the interior of the oven door. It's usually on the top of the oven (beneath the burner buttons), but it can sometimes be along the right- or left-hand side.[9] The oven door does need to be open for you to locate the door jamb and locking mechanism. Tip: Because each brand and model of oven is slightly different, you could look up a video or illustration
to show where your oven's locking mechanism is. The user manual also might have a detailed guide that will give you this information. 3 Push the door is shut. While the oven door is shut. While the oven door is still open, use a pair of pliers to push the hook or latch in to signal to the oven's computer that the door is shut. It's now
signaling that the oven is shut and locked, while neither is true.[10] You may be able to just push the latch in with your hand, but sometimes the opening is too slim. 4 Press the "Self-Clean" button, wait 10 seconds, then press "Clear/Off." Give the oven enough time to start prepping for the cleaning cycle—you can usually hear the computer whirring
and the oven gearing up to start the process. Once that happens, while still holding the door latch in, press the "Clear/Off" button.[11] This should hopefully reset the computer and remove the lock icon from the computer panel. The oven door must be kept open during this process, otherwise, it's possible that it could get stuck in the locked position
once the cleaning cycle is engaged. 5 Call a repair person if the lock icon is still displayed. If this doesn't work, it could mean that there is something wrong with those types of systems, it's generally less expensive and frustrating to have a
professional service company fix things for you. [12] When you call to set an appointment, check to make sure the company can work with the brand of oven you have. Advertisement Add New Question My Samsung oven wont open after self-cleaning, and the lights on panel wouldn't come on. After 3 weeks, lights on the panel came back on.
Any ideas? You likely have a wiring problem and should call an appliance repair technician to look at it, as it could pose a potential fire hazard. Question What do I do if my self-cleaning oven won't unlock when the door is open? You could try unplugging the oven for 5 minutes and then plugging it back in to see if that resets the computer panel.
Otherwise, you could try engaging the door's lock while it is open, starting the self-clean cycle, and then press "cancel/off" after 60 seconds to see if that prompts the lock icon to disappear. Question What do I do if my oven is locked with no power? You will need to wait until power is restored to try to get the door open. If the lock is engaged but there
is no power, there's no way to signify to your oven that it should be unlocked. Or, you could call a professional service company to come and manually open the door yourself, as you could permanently damage the locking mechanism. Ask a Question Advertisement This

guys. Oven door was stuck on locked and the handle was about to break from my frustration. I prayed for help and got the idea to unplug it, but was difficult to reach the plug. You guys helped, thanks."..." more Share your story If your Belling oven is showing the incorrect time on its digital display clock, you'll need to know how to change it to get
your oven displaying the right time again. However, the process of changing the time on an oven clock isn't always clear, which is why we're here to show you how to set the clock on a Belling oven step by step. There are a few possible reasons for your oven's timer to be displaying the wrong time. One is clocks jumping forwards or backwards with
daylight savings, which can leave your oven's display time an hour ahead or an hour behind if you haven't manually and will need to
change the time to get it back in action. Let's dive in! To learn how to change the time on a Belling oven ready to change the digital timer's display time, press the left and right buttons beneath the clock at the same time. You will now be able to adjust the
time. Pressing the left button beneath the clock backwards. Alternatively, if you need to adjust the clock forwards, the right button will do this. You can also hold down either the left or right button will do this. You can also hold down either the left or right button to change the time more quickly. This is handy if the time on the clock is a long way from the time you want to set it to. Once your
oven's display clock is at the correct time, you can lock the time on a Belling oven. Your oven's display clock should now be displaying the correct time. If you have reset the clock due to your oven not working but this has not fixed the issue,
head over to our Oven Advice Centre where we can help you diagnose and fix a wide range of oven problems yourself. Remember to also subscribe to our YouTube channel! There, you can find a wide range of resources, including our clock changing video playlist for a range of other household appliances, step-by-step repair guides, handy
maintenance advice and much more. Hi, A simple question on the use of Bosch multi-function electric ovens. I have just installed a single and double in the kitchen. On reading the use instructions it states that the temperature knobs must not be turned anti-clockwise. In other words if you set the temp to 180 and then want to reduce to 150 you have
to wind the thing on past the flat-out position, past clean, past go, to get back to 150. Now while this may be possible (I haven't tried it yet) I would bet my entire population has been doing with its temp knobs for the last umpteen years. Does
anyone know why Bosch have made this rule, and will the mechanism be damaged when the knob inevitably is turned anti-clockwise? Rgds. My guess unless its electronic thermostat. I think they mean from the OFF position. Hi, Thanks, I think you might be correct (and I now feel stupid). It shows how the first interpretation of a sentence can stick in
the mind. The quote from the book is: 'The function selector can be turned clockwise, whereas the temperature selector can only be turned clockwise, but I agree, it makes sense to mean from the off position. Rgds. If you need to find a tradesperson to get

mmDepth 600 mmHeight 930 mmHeight (min) 900 mmWeight 88000 g show more can't find the answer to your question in the FAQs about the Belling Farmhouse 90E below. Make sure the oven switch is turned on and the temperature dial is set correctly. Check if the oven element is working
properly by checking for visible signs of damage or burn marks. Clean the burner heads and caps to remove any accumulated food debris or grease that might be obstructing the flow of gas. Ensure that the burners are placed correctly in their respective positions and securely attached. Verify that the timer has been set correctly and the power supply
is functioning properly. If the timer still does not work, check if the fuse associated with the timer function has blown and free from any blockage, such as grease or food residue. Adjust the grill control to the desired heat level and allow sufficient time for preheating before placing food on
the grill. Ensure the appliance is correctly connected to a power supply and the gas supply is turned on. Check if the spark electrode and igniter are clean and, if needed, gently clean them using a soft brush. Verify that the spark lead is securely connected to the igniter. If problems persist, contact a qualified technician for further assistance. Yes, the
