What does the blue light on my dashboard mean

You can continue to drive, but this safety feature will likely be disabled. An external sensor on your vehicle monitors outside temperatures and triggers the snowflake warning light when temperatures fall to around 3°C. Your coolant light displaying blue means your vehicle is not at the right temperature for operations like movement. Ensure you use the recommended antifreeze for your vehicle - even during hot months as it increases the boiling temperature of water. So, if you see your coolant indicator showing blue and then red lights later, have it checked immediately and save yourself money and stress. Additionally, if your car has been running for extended periods of time in stop-and-go traffic or rough terrain, it might be helpful to let it rest for a bit before continuing driving. This is often an indication of an engine misfire, where unburnt fuel is dumped into the exhaust. If you experience this, take your car to the auto mechanic for repairs to avoid spending more money on situations aggravated by this one. Green Warning Lights Green dashboard warning lights are used to inform the driver that a vehicle utility device has been turned on and is in operation. You also risk endangering yourself in adverse weather conditions as the high beams can cause a glare. This is not an emergency but should be diagnosed and fixed as soon as possible. Dashboard Warning Light Colours To help with this, dashboard warning lights are colour-coded. Coolant Warning Light Meaning As soon as it's safe to do so, stop and switch off the engine. In this instance, the traction control (or stability control) light will come on. For further information on the DPF and how to regenerate (clean) your filter by driving, see DPF warning light meaning. Likely fault is a sensor and diagnostic equipment will be required. Varied amounts of braking force are applied on a per-wheel basis depending on the road surface which results in the best possible traction. In many vehicles, this light is also associated with SRS (Supplementary Restraint System) and your vehicle may display a 'SRS' warning light. ABS Warning Light Meaning The presence of the ABS light means this function is no longer in operation. Asides from blue, the coolant indicator can also glow red. STOP Warning Light The STOP warning light is used in certain car models to indicate a severe fault that requires immediate attention. Coolant oil has a sweet odor. To bring greater attention to the driver, a red light may also flash and/or be accompanied by an audible alarm. If this warning light appears, it should be addressed immediately to prevent potential engine damage from overheating. On the other hand, the blue light on the dashboard often indicates that your vehicle is not at the operational driving temperature yet, and it is not a cause for worry. Checking these levels at the wrong time after switching off a car can lead to a shower of scalding hot water on the face. If you have not manually switched off the system and light comes on, a fault has been detected and the system is disabled. Brake Warning (Yellow) Yellow Battery Warning Light Along with the red battery warning light, some vehicles also come equipped with a yellow battery warning light. The high beam symbol has five horizontal lines vertically stacked to the left of a shape resembling headlights. This could mean that either the coolant level is low or it could indicate a more serious problem such as a faulty thermostat or broken water pump. In cold weather, blue light from the coolant indicator is not something to worry about. If the levels are fine, then there may be an issue with the cooling system or engine temperature sensor which will require further inspection. One thing you notice right away when you turn on a car is colored lights that glow on the dashboard, giving you information about different parts of the vehicle. At each ignition cycle, ASR is activated, but can be disabled by use the ASR OFF button, or by navigating through the options on the display panel. Traction Control Warning Light Meaning Traction control can in most vehicles be switched off. Worn Brake Pads Brake Pads Warning Light Not all vehicles come equipped with a worn brake pads warning system. Ignoring the blue light can lead to more serious issues down the road that are expensive and dangerous for you and other drivers on the road. A persistent blue coolant light indicates a possible deficiency of coolant in the cooling system. If a fault is detected, your vehicle may have a dedicated EBD dash light or a combination of or + EBD Warning Light Meaning If your vehicle has an EBD fault, have it checked immediately. Tortoise Warning Light The tortoise warning light (sometimes mistaken for a turtle) is often associated with fully electric and hybrid cars. If the yellow warning light comes back on after fully charging, look into possible faults of a red warning light detailed above. Another blue light you will see on the dashboard is the headlight indicator. Blue light in car windshields is a relatively new technology that helps to reduce glare, improve visibility, and make driving safer. It's important to check your dashboard for more information about what this could mean and take action as soon as possible. When you see a blue light on your dashboard, it indicates that you have low levels of coolant in your engine. If the yellow battery warning light illuminates, it means the battery has a low state of charge. It is a safety feature that most drivers are surprisingly not aware of. Then, wait for the engine to get cold before checking your antifreeze levels. You can also switch off stability control, which in turn will also disable traction control. Amber or Yellow Warning Lights Amber or yellow dashboard warning lights are usually a secondary warning informing that a system or engine requires servicing or maintenance. For possible reasons why this warning light is illuminating, see oil temperature warning light. Other faults are often due to a faulty sensor. Limp Mode Limp Mode Warning Light Similar to the check engine or engine management light above, limp mode is a protective safety feature that lowers the engine power output when a fault has been detected, therefore reducing the potential of damage. Rear Fog Lights Warning Light Meaning It is mandatory in the UK since April 1st 1986 that all vehicles are fitted with red rear fog lights. The check engine dashboard warning light looks serious but is usually nothing too urgent. See worn / low brake pads warning light for further information. If a red one follows the blue light, your coolant level is too low, and your engine is overheating. Naturally, if you often drive long distances, you should have regular maintenance checks than the average worker who only takes a few miles to work and back every day. Check Engine Warning Light Meaning Constantly on: Often associated with an emissions fault and an incorrect fuel mixture. The next place your vehicle should be after that is the mechanic's workshop. For further information on what cold tyre pressure means and how to check tyre pressures when cold or hot, see cold tyre pressure explained. It could be a warning of low oil or coolant levels, a loose gas cap, a malfunctioning emissions system, or any other issue that requires immediate attention. These are two major causes of low levels of coolant in an engine: The gradual dropping of coolant levels can happen due to leaks in the system. Therefore, ensuring you have the right amount of coolant before the winter hits will ensure you do not worry about the blue light on your dashboard. Diagnostic code readers are required to locate the fault. Front Fog Lights Warning Light Meaning Unlike rear fog lights, front fog lights are not a legal requirement. Exterior Lights Symbol Exterior Lights Warning Light This dashboard light informs the driver that the exterior lights / sidelights / parking lights / headlights are switched on. Modern diagnostic code readers are easy to use and are now affordable. For more information on why this light may have come on, see reduced engine power warning light. An explanation of what the dash symbol means and what you need to do is given. Credit: commons.wikimedia.org The little blue light on your car is a notification that something in the vehicle needs attention. In the event of a loss of traction, the brakes are automatically pumped quickly until traction is regained. The low beam headlights will still enable you to see where you are going (though not as far as the high beam headlights would). Leaks can occur on the hoses, radiator, or radiator cap. The first step is to check your coolant levels; if they are low, you should top off the reservoir with a 50/50 mixture of antifreeze and distilled water. Red Warning Lights Red dashboard warning lights are primary warnings. Dashboard warning lights are not always easy to understand. Vehicle may become dangerously unstable. By being familiar with its purpose and how it works, you can ensure a safer driving experience. It could be anything from a low tyre pressure, an electrical problem, or an oil leak. Fog lights must only be used when visibility is significantly reduced and must be switched off when parked. If you see the blue light illuminated, it's best not to ignore it and take your car in for servicing as soon as possible. Brake Warning Light Meaning The manual handbrake is applied. They are best used at night when the weather is fair, and the roads are clear. For further information, see stop warning light explained. Yellow Battery Warning Light Meaning Leaving the battery to charge overnight will fix the yellow battery warning light issue or a long car journey. You should stop driving when the coolant indicator turns red and wait for the engine to cool down. If, when starting your car, the coolant light glows blue and then progresses to red after you have driven for some time, it is a sign that your coolant levels are too low. Stability Control Warning Light Meaning Constantly on: Stability control has been manually deactivated or if stability control has not been manually deactivated, there is a fault with the system. They are so low that they cannot function properly, leaving the engine to heat up without sufficient coolants to reduce its temperature. The stop warning light may come on along with other warning lights, with a warning text and audible alert. Car Fault Codes When a fault is detected, a warning light is produced along with a fault code. Relying on high beam headlights alone is not advisable. Possible faulty sensor. It is easy to assume you do not have enough coolant in the winter because temperatures drop, and the car will need more warming up than usual. Flashing: Stability control has detected instability and is actively engaged. DPF Warning Light DPF Warning Light In order to curb harmful emissions, most diesel cars have been fitted with diesel particulate filters (DPF) since 2009. However, it is a relatively new technology, and until most production cars have it installed, it would be best if you are conscious of how you use your headlights. Auto High Beam Automatic High Beam Warning Light Automatic high beam headlights automatically switch between high main / beam and low / dipped beam. This dashboard warning light may also spell the word . Perceiving this sweet odor, plus an increase in the amount of gas you buy, should tell you that you have coolant leaking. It is essential to be patient while waiting for your engine to cool before checking your antifreeze levels. After a predetermined time, detected by sensors within the filter, it requires cleaning, either passively, actively or by forced regeneration. Suppose your car starts anyway, with the coolant icon displaying blue for too long; first, switch off the vehicle. As the warning suggests, if the stop light illuminates, safely pull off the road and switch off the engine. Amber lights and yellow usually denote a less severe problem or hazard. If the light comes on when driving or does not come on at all during ignition, there is a fault with the air bag system. If you see this warning light, your vehicle has an electronic brake pads wear sensors that alert the driver when the remaining pad levels are low. High Coolant Temperature Coolant Warning Light This red dash warning light is telling you that the engine coolant temperature is too high. Tyre Pressure Warning Light Meaning Stop as soon as safely possible and check tyres. High Beam Symbol High Beam Warning Light The high beam symbol is a blue symbol with five horizontal lines vertically stacked to the left of a shape that resembles a headlight. Be cautious until you have the system fixed as heavy braking may result in the wheels locking. When traffic ahead is seen, high beam headlights must be switched to low / dipped beam to prevent dazzle to other road users. This could mean anything from an engine malfunction to a low fluid level, or even a warning about the brakes needing repair. This causes extreme temperatures and can damage the catalytic converter. Seat belt pretensioner faults can occur. The time it takes for coolant levels to drop to the point that they are too low for use depends on the car manufacturer and your driving habits. It's important to be aware of the blue light for safety reasons, as it will inform you when something has gone wrong with your vehicle. If it is neither the handbrake or brake fluid, there may be a fault with the vehicle braking system. Most drivers are ignorant about coolant top-ups and tend not to do it until something happens. Blue dashboard warning lights are usually only associated with full / high beam headlights being in operation, or that something is cold, such as the engine coolant. Brake Pads Warning Light Meaning The low brake pads warning light requires you to have the brake pads changed soon. When a car is started, the blue coolant light may come on as an indication that there is an issue with the vehicle's cooling system. For more information about the common reasons for the check engine warning light to come on, how to scan for Diagnostic Trouble Codes and what to do when the engine warning light comes on, see reasons why the engine warning light is on. Brake Warning (Red) Red Battery Warning Light The red battery warning light comes on as a bulb check briefly when the ignition or engine start button is switched to 'on'. The blue coolant light (when prolonged) indicates low levels of coolant in the engine. For more information, see What ESC is in Cars and How Does ESC Work in Cars. Failing to do so may result in damage to your vehicle and potentially serious injury if left unchecked. Rear Fog Light Symbol Rear Fog Lights Warning Light This symbol represents the rear fog lights being switched on. Airbag Warning ABS Warning Light The air bag or 'airbag' dashboard warning light should go out shortly after engine ignition. If the warning light is generic and has many potential faults associated with it and if your vehicle doesn't display fault codes, you'll either need to have the codes read by an engineer using their own diagnostic equipment, or you'll need to use your own. Fill to the MAX. It would help if you only use your high beam headlights when you are more than twenty feet behind another vehicle, and no heavy rain, fog, or snow is present. Some vehicles display the fault code, whilst others store it in memory but do not display it. Diesel particulate filters can cause issues for driver of diesel vehicles, particularly those that mainly take short journeys. The blue symbol will go off once the headlights are switched to low beams. Last Updated on June 22, 2023 by Ryan The blue light in your car is an indicator that something needs attention. Brake Warning Brake Warning Light This red exclamation mark contained in a circle has slightly varied meanings based on each car manufacturer. Limp Mode Warning Light Meaning Often related to faulty valve / incorrect fuel mixture causing engine misfire. ABS Warning ABS Warning Light Anti-lock braking system or 'ABS' is a feature that helps the driver to keep control of the vehicle under heavy braking. It should go out when the engine starts. Severe risk of engine damage with continued driving. Have diagnostic equipment connected by an engineer to establish faults codes to fix the fault. Some new models have a technology that moderates your headlights for you. When the blue coolant light comes on, it is important to take action immediately. See why is my car battery warning light on for further information. See tortoise car warning light symbol for further information. EBD Warning EBD Warning Light Electronic Brake Force Distribution (EBD) is another braking aid. Electronic Stability Control (ESC) Stability Control Warning Light Stability control, also known as Dynamic Stability Control (DSC) or Electronic Stability Control (ESC) is a safety feature that that uses various sensors and helps to stabilise a vehicle when a loss of stability has been detected. The technology uses your environment and the weather to control the intensity of your beam, taking it high or low when needed. It is best to check your coolant levels twice a year - just before winter and summer. This article will explain why the blue light glows on the dashboard and when it should be a cause of concern. The blue light is applied directly to the windshield as a thin coating of nanoparticles which help to filter out harmful UV rays while allowing visible light through. Allow several minute for the engine to cool and check engine coolant levels. The long-term consequence is permanent damage to the engine from overheating. If you experience this, you should take your vehicle to the auto mechanic at once to prevent damage to your engine from overheating. Amber lights may also be illuminated when something has been deactivated manually when by default, it is active. For further information, see red engine coolant warning light on or flashing. If you're willing and able to repair your own vehicle, diagnostic equipment is a must. Check Engine Warning Check Engine Warning Light The check engine light or malfunction indicator light (MIL) is a generic warning symbol that has many potential faults associated with it. It does this by preventing the wheels from locking and as such, allows the driver to continue to steer and control the vehicle. Blue light in cars can be distracting for drivers and passengers alike. Most automatic high beam systems use a camera mounted behind the windscreen at the top centre. Green and white lights indicate a feature such as a cruise control or headlights is engaged. Stability control dashboard light may either come on constantly or flash. Coolants are vital because they keep the engine from overheating. The symbol typically comes on along with a text message or a warning light. Frequent short journeys do not allow the battery to charge properly. If the battery becomes exhausted, it's likely the engine may stop. There are various symptoms of low coolant, but only a few reasons behind them. In some cases, your engine may freeze, making your car unable to start. For further information on the frost warning light, see snowflake dashboard warning light explained. This will emit harmful exhaust emissions and will likely increase fuel consumption. marker on the coolant header tank if required. It may also come on alone. Therefore, if your blue coolant light stays on for too long while driving, it would be best to locate the nearest car repair shop to have an auto mechanic look into the case. Continuous usage of a car that is overheating will induce and increase damage to the engine. Driving with a blue coolant light on can be dangerous and should be avoided. If you do not address the situation, your engine will either overheat or seize up. Make your way immediately to a vehicle repair shop. ABS is an 'add-on' to standard brakes and therefore standard brakes continue to work as usual. If you switch off the ASR system, the ASR OFF warning light displays on your dashboard. Seat Belt Warning Seat Belt Warning Light The seat belt dashboard warning light illuminates on the majority of vehicles and will usually emit an audible alarm if any vehicle occupants do not fasten their belt. Some vehicles allow parking lights to remain on. A DPF collects harmful diesel soot and traps it. Additionally, blue light is known to interfere with the body's natural circadian rhythm, leading to difficulty sleeping after long car rides. Sometimes, low coolant levels are not because of leakage. Overheating can even cost you your entire engine. This helps drivers see better and reduces eyestrain from long drives, ultimately leading to fewer accidents on the road. For this scenario, the blue display from the coolant icon on your dashboard means that your antifreeze (coolant) is too cold. If you see this light, it is important to take action immediately. See why is my car battery warning light on for further information. See tortoise car warning light symbol for further information. EBD Warning EBD Warning Light Electronic Brake Force Distribution (EBD) is another braking aid. Electronic Stability Control (ESC) Stability Control Warning Light Stability control, also known as Dynamic Stability Control (DSC) or Electronic Stability Control (ESC) is a safety feature that that uses various sensors and helps to stabilise a vehicle when a loss of stability has been detected. The technology uses your environment and the weather to control the intensity of your beam, taking it high or low when needed. It is best to check your coolant levels twice a year - just before winter and summer. This article will explain why the blue light glows on the dashboard and when it should be a cause of concern. The blue light is applied directly to the windshield as a thin coating of nanoparticles which help to filter out harmful UV rays while allowing visible light through. Allow several minute for the engine to cool and check engine coolant levels. The long-term consequence is permanent damage to the engine from overheating. If you experience this, you should take your vehicle to the auto mechanic at once to prevent damage to your engine from overheating. Amber lights may also be illuminated when something has been deactivated manually when by default, it is active. For further information, see red engine coolant warning light on or flashing. If you're willing and able to repair your own vehicle, diagnostic equipment is a must. Check Engine Warning Check Engine Warning Light The check engine light or malfunction indicator light (MIL) is a generic warning symbol that has many potential faults associated with it. See why is my car battery warning light on for further information. See tortoise car warning light symbol for further information. EBD Warning EBD Warning Light Electronic Brake Force Distribution (EBD) is another braking aid. Electronic Stability Control (ESC) Stability Control Warning Light Stability control, also known as Dynamic Stability Control (DSC) or Electronic Stability Control (ESC) is a safety feature that that uses various sensors and helps to stabilise a vehicle when a loss of stability has been detected. The technology uses your environment and the weather to control the intensity of your beam, taking it high or low when needed. It is best to check your coolant levels twice a year - just before winter and summer. This article will explain why the blue light glows on the dashboard and when it should be a cause of concern. The blue light is applied directly to the windshield as a thin coating of nanoparticles which help to filter out harmful UV rays while allowing visible light through. Allow several minute for the engine to cool and check engine coolant levels. The long-term consequence is permanent damage to the engine from overheating. If you experience this, you should take your vehicle to the auto mechanic at once to prevent damage to your engine from overheating. Amber lights may also be illuminated when something has been deactivated manually when by default, it is active. For further information, see red engine coolant warning light on or flashing. If you're willing and able to repair your own vehicle, diagnostic equipment is a must. Check Engine Warning Check Engine Warning Light The check engine light or malfunction indicator light (MIL) is a generic warning symbol that has many potential faults associated with it. It does this by preventing the wheels from locking and as such, allows the driver to continue to steer and control the vehicle. Blue light in cars can be distracting for drivers and passengers alike. Most automatic high beam systems use a camera mounted behind the windscreen at the top centre. Green and white lights indicate a feature such as a cruise control or headlights is engaged. Stability control dashboard light may either come on constantly or flash. Coolants are vital because they keep the engine from overheating. The symbol typically comes on along with a text message or a warning light. Frequent short journeys do not allow the battery to charge properly. If the battery becomes exhausted, it's likely the engine may stop. There are various symptoms of low coolant, but only a few reasons behind them. In some cases, your engine may freeze, making your car unable to start. For further information on the frost warning light, see snowflake dashboard warning light explained. This will emit harmful exhaust emissions and will likely increase fuel consumption. marker on the coolant header tank if required. It may also come on alone. Therefore, if your blue coolant light stays on for too long while driving, it would be best to locate the nearest car repair shop to have an auto mechanic look into the case. Continuous usage of a car that is overheating will induce and increase damage to the engine. Driving with a blue coolant light on can be dangerous and should be avoided. If you do not address the situation, your engine will either overheat or seize up. Make your way immediately to a vehicle repair shop. ABS is an 'add-on' to standard brakes and therefore standard brakes continue to work as usual. If you switch off the ASR system, the ASR OFF warning light displays on your dashboard. Seat Belt Warning Seat Belt Warning Light The seat belt dashboard warning light illuminates on the majority of vehicles and will usually emit an audible alarm if any vehicle occupants do not fasten their belt. Some vehicles allow parking lights to remain on. A DPF collects harmful diesel soot and traps it. Additionally, blue light is known to interfere with the body's natural circadian rhythm, leading to difficulty sleeping after long car rides. Sometimes, low coolant levels are not because of leakage. Overheating can even cost you your entire engine. This helps drivers see better and reduces eyestrain from long drives, ultimately leading to fewer accidents on the road. For this scenario, the blue display from the coolant icon on your dashboard means that your antifreeze (coolant) is too cold. If you see this light, it is important to take action immediately. See why is my car battery warning light on for further information. See tortoise car warning light symbol for further information. EBD Warning EBD Warning Light Electronic Brake Force Distribution (EBD) is another braking aid. Electronic Stability Control (ESC) Stability Control Warning Light Stability control, also known as Dynamic Stability Control (DSC) or Electronic Stability Control (ESC) is a safety feature that that uses various sensors and helps to stabilise a vehicle when a loss of stability has been detected. The technology uses your environment and the weather to control the intensity of your beam, taking it high or low when needed. It is best to check your coolant levels twice a year - just before winter and summer. This article will explain why the blue light glows on the dashboard and when it should be a cause of concern. The blue light is applied directly to the windshield as a thin coating of nanoparticles which help to filter out harmful UV rays while allowing visible light through.
