Generated on Thu Jul 13 17:25:35 2023 by LATEXml Lintao Peng, Chunli Zhu, Liheng Bian | Beijing Institute of Technology The light absorption and scattering of underwater impurities lead to poor underwater imaging quality. The existing data-driven based underwater image enhancement (UIE) techniques suffer from the lack of a large-scale dataset containing various underwater scenes and high-fidelity reference images. Besides, the inconsistent attenuation in different color channels and space areas is not fully considered for boosted enhancement. In this work, we constructed a large-scale underwater image (LSUI) dataset including 4279 image pairs, and reported an U-shape Transformer network where the transformer model is for the first time introduced to the UIE task. The U-shape Transformer is integrated with a channel-wise multi-scale feature fusion transformer (CMSFFT) module and a spatial-wise global feature modeling transformer (SGFMT) module, which reinforce the network's attention to the color channels and space areas with more serious attenuation. Meanwhile, in order to further improve the contrast and saturation, a novel loss function combining RGB, LAB and LCH color spaces is designed following the human vision principle. The extensive experiments on available datasets validate the state-of-the-art performance of the reported technique with more than 2dB superiority. [arXiv] [Code] [Data] 1. We reported a novel U-shape Transformer dealing with the UIE task, in which the designed channel-wise and spatial-wise attention mechanism enables to effectively remove color artifacts and casts. 2. We designed a novel multi-color space loss function combing the RGB, LCH and LAB color-space features, which further improves the contrast and saturation of output images. 3. We released a large-scale underwater dataset containing 4279 image pairs, which facilitates further development of underwater imaging techniques. 4. Extensive experiments have show that the U-shape transformer we proposed combined with the multi-color space loss function achieves state-of-the-art performance on several public datasets and our dataset. We released a large-scale dataset(LSUI) containing 4279 real underwater images and the corresponding high-quality reference images, semantic segmentation maps, and medium transmission map for each image. You can download it from [BaiduYun(password is lsui)] or [GoogleDrive]. If you want to use the LSUI dataset, please cite our [paper] Fig 1. Detailed network structure. The model is modified based on Unet-GAN. In order to guide the network to pay attention to the more severely attenuated color channels and spatial regions, we introduced the CMSFFT module and SGFMT module based on transformer architecture. In order to make the training process of our node more stable, we added a multi-scale gradient flow mechanism to the network. Fig 2. SGFMT data flow diagram. Fig 3. CMSFFT detailed structure Fig 4. Evaluation with Reference Images on Test-L504 and Test-U90 Tab 8. Evaluation without Reference Images on Test-U60 and SQUID Lintao Peng, Chunli Zhu, and Liheng Bian. "U-shape Transformer for Underwater Image Enhancement", 2021 @misc{peng2021ushape, title={U-shape Transformer for Underwater Image Enhancement}, author={Lintao Peng and Chunli Zhu and Liheng Bian}, year={2021}, eprint={2111.11843}, archivePrefix={arXiv}, primaryClass={cs.CV} } LSUI is a large-scale underwater image dataset including 4279 image pairs, which covers more abundant underwater scenes(lightning conditions, water types and target categories) and better visual quality reference images than existing underwater datasets . The dataset contains 4279 real-world underwater images, and the corresponding clear images are generated as comparison references. We also provide the semantic segmentation map and medium transmission map for each image. You can download it from here[lsui]. Our paper is under review, and once accepted, we will publish the corresponding semantic segmentation map and media transfer map. Fig. 1: LSUI DatasetCodeU-shape Transformer You can find the official PyTorch implementation of U-shape Transformer for Underwater Image Enhancement. (arxiv, Dataset, video demo, visual results) in here. U-shape Transformer achieves state-of-the-art performance in underwater image enhancement task. Fig. 2: U-shape Transformer Image Inpainting Large-scale underwater image dataset We released a large-scale underwater image (LSUI) dataset including 5004 image pairs, which involve richer underwater scenes (lighting conditions, water types and target categories) and better visual quality reference images than the existing ones. Welcome! This is the official implementation of the paper "Adaptive Dual-domain Learning for Underwater Image Enhancement". [Paper] [LSUI Datasets] [2025.04] We release the code and data for SS-UIE [2024.12] The conference paper is accepted by AAAI 2025 [2024.07] The conference paper is submitted to AAAI 2025 We propose a novel UIE method based on spatial-spectral dual-domain adaptive learning, termed SS-UIE. Specifically, we first introduce a spatial-wise Multi-scale Cycle Selective Scan (MCSS) module and a Spectral-Wise Self-Attention (SWSA) module, both with linear complexity, and combine them in parallel to form a basic Spatial-Spectral block (SS-block). Benefiting from the global receptive field of MCSS and SWSA, SS-block can effectively model the degradation levels of different spatial regions and spectral bands, thereby enabling degradation level-based dual-domain adaptive UIE. By stacking multiple SS-blocks, we build our SS-UIE network. Additionally, a Frequency-Wise Loss (FWL) is introduced to narrow the frequency-wise discrepancy and reinforce the model's attention on the regions with high-frequency details. Extensive experiments validate that the SS-UIE technique outperforms state-of-the-art UIE methods while requiring cheaper computational and memory costs. The main contributions of our paper are as follows: Our proposed MCSS and SWSA module can obtain the spatial-wise and spectral-wise global receptive fields with linear complexity, respectively, thereby modeling the degradation levels in different spatial regions and spectral bands. We combined MCSS and SWSA in parallel to form an SS-block, which can reinforce the network's attention to the spatial regions and spectral bands with serious attenuation, and achieve degradation level-based adaptive UIE. The proposed FWL function can narrow the frequency-wise discrepancy, and force the model to restore high-frequency details adaptively without additional memory and computational costs. Our SS-UIE outperforms SOTA UIE methods in quantitative evaluation and visual comparison with cheaper computational and memory costs. git clone cd SS-UIE To set up the environment for this project, follow the steps below: conda create -n your_env_name python=3.10 conda activate your_env_name conda install pytorch==2.2.1 torchvision==0.17.1 torchaudio==2.2.1 pytorch-cuda=11.8 -c nvidia conda install -c "nvidia/label/cuda-11.8.0" cuda-nvcc conda install packaging pip install timm pip install scikit-image pip install opencv-python pip install causal_conv1d==1.1.1 pip install mamba-ssm==1.1.1 If you cannot install causal_conv1d and mamba-ssm, you can download the whl file we provide and install it directly using the local whl file. The download link is causal_conv1d and mamba-ssm. Then run, pip install causal_conv1d-1.2.0.post2+cu118torch2.1cxx11abiFALSE-cp310-cp310-linux_x86_64 pip install mamba_ssm-1.1.1+cu118torch2.1cxx11abiFALSE-cp310-cp310-linux_x86_64 If you need to train our SS-UIE from scratch, you need to download the LSUI dataset from BaiduYun(password is lsui) or GoogleDrive, and then randomly select 3879 picture pairs as the training set to replace the data folder, and the remaining 400 as the test set to replace the test folder. The dataset divided by the author can be downloaded from BaiduYun(password is lsui). Then, run the train.py, and the trained model weight file will be automatically saved in saved_Models folder. For your convenience, we provide some example datasets in ./data folder. You can download the pretrain models in BaiduYun with the password CKPT or in Google Drive. After downloading, extract the pretrained model into the ./saved_models folder, and then run test.ipynb. The code will use the pretrained model to automatically process all the images in the ./data/Test_400/input folder and output the results to the ./data/Test_400/output folder. The LSUI is a large-scale underwater image (LSUI) dataset, which involves richer underwater scenes (lighting conditions, water types and target categories) and better visual quality reference images than the existing ones. You can download it from BaiduYun(password is lsui) or [GoogleDrive]. If you want to use the LSUI dataset, please cite our [paper] @inproceedings{peng2025adaptive, title={Adaptive Dual-domain Learning for Underwater Image Enhancement}, author={Peng, Lintao and Bian, Liheng}, booktitle={Proceedings of the AAAI Conference on Artificial Intelligence}, volume={39}, number={6}, pages={6461-6469}, year={2025} } [U-shape] U-shape Transformer for Underwater Image Enhancement This repository is the official PyTorch implementation of U-shape Transformer for Underwater Image Enhancement. (arxiv, Dataset[lsui], video demo, visual results). U-shape Transformer achieves state-of-the-art performance in underwater image enhancement task. News: 2025/5/9 Our work SS-UIE has been accepted by AAAI-2025, code and models are released in SS-UIE. 2021/11/25 We released our pretrained model, You can download the pretrain models in BaiduYun with the password tdg9 or in Google Drive. 2021/11/24 We released the official code of U-shape Transformer 2021/11/23 We released LSUI dataset, We released a large-scale underwater image (LSUI) dataset, which involves richer underwater scenes (lighting conditions, water types and target categories) and better visual quality reference images than the existing ones. You can download it from [here][lsui] or GoogleDrive. The training and test set divided by the author can be downloaded from BaiduYun(password is lsui) or GoogleDrive. The light absorption and scattering of underwater impurities lead to poor underwater imaging quality. The existing data-driven based underwater image enhancement (UIE) techniques suffer from the lack of a large-scale dataset containing various underwater scenes and high-fidelity reference images. Besides, the inconsistent attenuation in different color channels and space areas is not fully considered for boosted enhancement. In this work, we constructed a large-scale underwater image (LSUI) dataset, and reported an U-shape Transformer network where the transformer model is for the first time introduced to the UIE task. The U-shape Transformer is integrated with a channel-wise multi-scale feature fusion transformer (CMSFFT) module and a spatial-wise global feature modeling transformer (SGFMT) module, which reinforce the network's attention to the color channels and space areas with more serious attenuation. Meanwhile, in order to further improve the contrast and saturation, a novel loss function combining RGB, LAB and LCH color spaces is designed following the human vision principle. The extensive experiments on available datasets validate the state-of-the-art performance of the reported technique with more than 2dB superiority. Training Testing Results Citation License and Acknowledgement If you need to train our U-shape transformer from scratch, you need to download our dataset from BaiduYun(password is lsui) or GoogleDrive, and then randomly select 3879 picture pairs as the training set to replace the data folder, and the remaining 400 as the test set to replace the test folder. The dataset divided by the author can be downloaded from BaiduYun(password is lsui). Then, run the train.ipynb file with Jupiter notebook, and the trained model weight file will be automatically saved in saved_Models folder. As described in the paper, we recommend you use L2 loss for the first 600 epochs and L1 loss for the last 200 epochs. Environmental requirements: Python 3.7 or a newer version Pytorch 1.7 Or a newer version CUDA 10.1 or a newer version OpenCV 4.5.3 or a newer version Jupyter Notebook Or you can install from the requirements.txt using pip install -r requirements.txt For your convenience, we provide some example datasets (~20Mb) in ./test. You can download the pretrain models in BaiduYun with the password tdg9 or in Google Drive. After downloading, extract the pretrained model into the project folder and replace the ./saved_models folder, and then run test.ipynb. The code will use the pretrained model to automatically process all the images in the ./test/input folder and output the results to the ./test/output folder. In addition, the output result will automatically calculate the PSNR value with the reference image. The LSUI is a large-scale underwater image (LSUI) dataset, which involves richer underwater scenes (lighting conditions, water types and target categories) and better visual quality reference images than the existing ones. You can download it from BaiduYun(password is lsui) or GoogleDrive. If you want to use the LSUI dataset, please cite our [paper] We achieved state-of-the-art performance on underwater image enhancement task. Detailed results can be found in the paper or our project page Full-Reference Evaluation (click me) Non-reference Evaluation @ARTICLE{10129222, author={Peng, Lintao and Zhu, Chunli and Bian, Liheng}, journal={IEEE Transactions on Image Processing}, title={U-Shape Transformer for Underwater Image Enhancement}, year={2023}, volume={32}, number={}, pages={3066-3079}, doi={10.1109/TIP.2023.3276332}} This project is released under the MIT license. The codes are designed based on pix2pix. We also refer to codes in UCTransNet and TransBTS. Please also follow their licenses. Thanks for their awesome works.
